FLEET PREVENTIVE MAINTENANCE SYSTEM

Fleet Preventive Maintenance System provides following and controlling the vehicles of the companies which have rented vehicles within the field.

Due to the system, the periodical maintenance and service processes of the vehicles are taken under control and recorded, and unnecessary expenses arising from negligence or forgetfulness are eliminated. The companies can manage their fleet efficiently and completely by this system.

- All the vehicle information for the fleet is recorded in the system. Once the system is populated by vehicle details, the periodical maintenance and service processes of the vehicles are determined in the system based on make, model and year of the vehicle. By the data collected from the km. indicator of the vehicle, the maintenance times of the vehicles are automatically identified and necessary notifications are sent to related parties as service reminders.

- Detailed information regarding improper usage of the vehicle such as skidding, rapid acceleration and deceleration, etc. is recorded and the report of all the services performed on the vehicle as well as replacement parts are reported along with their costs.

- Vehicle registration and insurance expiration dates are recorded in the system. The system sends reminder messages to the users prior to the expiration date to avoid any late payment penalties and to ensure accordance with laws.

Together with the fleet periodical maintenance and service tracking system, the companies manage their fleets from a single web-based interface by taking them under control. Through the system, significant savings on vehicle maintenance expenses, fuel, time, labor and penalties are realized.
